ABSTRACT OF THE DISCLOSURE

The present invention is a system and method of enrolling potential system users for a biometric system for identity verification. A system user pre-enrolls a desired amount of information used to enable enrollment and that information is stored in a system user record in a system database. A system user enables enrollment into the system by presenting other enrollment information not provided during a previous partial enrollment. Enrollment data is used to authenticate the system user's identity and authorize related transaction accesses in a biometric system for identity verification.
